Chapter 4 Principle of Mathematical Induction Exercise 4.1 Solutions

Exercise 4.1 : Solutions of Questions on Page Number : 94 Q1 :

Prove the following by using the principle of mathematical induction for all  $n \in N$ :

$$1 + 3 + 3^{2} + \dots + 3^{n-1} = \frac{(3^{n} - 1)}{2}$$

# Answer :

Let the given statement be P(n), i.e.,

P(n): 1 + 3 + 3<sup>2</sup> + ... + 3<sup>n-1</sup> = 
$$\frac{(3^n - 1)^n}{2}$$

For n = 1, we have

P(1): 1 = 
$$\frac{(3^{1}-1)}{2} = \frac{3-1}{2} = \frac{2}{2} = 1$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$1+3+3^{2}+\ldots+3^{k-1}=\frac{(3^{k}-1)}{2} \qquad \dots (i)$$

We shall now prove that P(k + 1) is true.

Consider

 $1 + 3 + 3<sup>2</sup> + \dots + 3<sup>k-1</sup> + 3<sup>(k+1)-1</sup>$ = (1 + 3 + 3<sup>2</sup> + \dots + 3<sup>k-1</sup>) + 3<sup>k</sup>

$$= \frac{(3^{k} - 1)}{2} + 3^{k} \qquad [Using (i)]$$
$$= \frac{(3^{k} - 1) + 2 \cdot 3^{k}}{2}$$
$$= \frac{(1 + 2)3^{k} - 1}{2}$$
$$= \frac{3 \cdot 3^{k} - 1}{2}$$
$$= \frac{3^{k+1} - 1}{2}$$

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

## Q2 :

Prove the following by using the principle of mathematical induction for

all 
$$n \in N$$
:  $1^3 + 2^3 + 3^3 + ... + n^3 = \left(\frac{n(n+1)}{2}\right)^2$ 

#### Answer :

Let the given statement be P(n), i.e.,

P(n): 
$$1^3 + 2^3 + 3^3 + \dots + n^3 = \left(\frac{n(n+1)}{2}\right)^2$$

For n = 1, we have

P(1): 
$$1^3 = 1 = \left(\frac{1(1+1)}{2}\right)^2 = \left(\frac{1.2}{2}\right)^2 = 1^2 = 1$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$1^{3} + 2^{3} + 3^{3} + \dots + k^{3} = \left(\frac{k(k+1)}{2}\right)^{2} \qquad \dots (i)$$

We shall now prove that P(k + 1) is true.

Consider

 $1^3 + 2^3 + 3^3 + \dots + k^3 + (k+1)^3$ 

$$= \left(\frac{k(k+1)}{2}\right)^{2} + (k+1)^{3} \qquad [Using (i)]$$

$$= \frac{k^{2}(k+1)^{2}}{4} + (k+1)^{3}$$

$$= \frac{k^{2}(k+1)^{2} + 4(k+1)^{3}}{4}$$

$$= \frac{(k+1)^{2} \left\{k^{2} + 4(k+1)\right\}}{4}$$

$$= \frac{(k+1)^{2} \left\{k^{2} + 4k + 4\right\}}{4}$$

$$= \frac{(k+1)^{2} (k+2)^{2}}{4}$$

$$= \frac{(k+1)^{2} (k+1+1)^{2}}{4}$$

$$= \left(\frac{(k+1)(k+1+1)}{2}\right)^{2}$$
.... + k^{2}) + (k+1)^{3}

 $=(1^{3}+2^{3}+3^{3}+$ 

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

# Q3 :

# Prove the following by using the principle of mathematical induction for

all 
$$n \in N$$
:  $1 + \frac{1}{(1+2)} + \frac{1}{(1+2+3)} + \dots + \frac{1}{(1+2+3+\dots n)} = \frac{2n}{(n+1)}$ 

Answer :

Let the given statement be P(n), i.e.,

P(n): 
$$1 + \frac{1}{1+2} + \frac{1}{1+2+3} + \dots + \frac{1}{1+2+3+\dots n} = \frac{2n}{n+1}$$

For n = 1, we have

P(1): 1 = 
$$\frac{2.1}{1+1} = \frac{2}{2} = 1$$
 which is true.

Let P(k) be true for some positive integer k, i.e.,

$$1 + \frac{1}{1+2} + \dots + \frac{1}{1+2+3} + \dots + \frac{1}{1+2+3+\dots+k} = \frac{2k}{k+1} \qquad \dots (i)$$

We shall now prove that P(k + 1) is true.

Consider

$$\begin{aligned} 1 + \frac{1}{1+2} + \frac{1}{1+2+3} + \dots + \frac{1}{1+2+3+\dots+k} + \frac{1}{1+2+3+\dots+k+(k+1)} \\ &= \left(1 + \frac{1}{1+2} + \frac{1}{1+2+3} + \dots + \frac{1}{1+2+3+\dots+k}\right) + \frac{1}{1+2+3+\dots+k+(k+1)} \\ &= \frac{2k}{k+1} + \frac{1}{1+2+3+\dots+k+(k+1)} \qquad [Using (i)] \\ &= \frac{2k}{k+1} + \frac{1}{\left(\frac{(k+1)(k+1+1)}{2}\right)} \qquad \left[1+2+3+\dots+n=\frac{n(n+1)}{2}\right] \\ &= \frac{2k}{(k+1)} + \frac{2}{(k+1)(k+2)} \\ &= \frac{2}{(k+1)} \left(k + \frac{1}{k+2}\right) \\ &= \frac{2}{(k+1)} \left(\frac{k(k+2)+1}{k+2}\right) \\ &= \frac{2}{(k+1)} \left(\frac{k^2+2k+1}{k+2}\right) \\ &= \frac{2\cdot(k+1)^2}{(k+1)(k+2)} \\ &= \frac{2(k+1)}{(k+2)} \end{aligned}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

## Q4 :

Prove the following by using the principle of mathematical induction for all  $n \in N$ : 1.2.3 + 2.3.4 + ... + n(n + 1)

$$(n+2) = \frac{n(n+1)(n+2)(n+3)}{4}$$

Let the given statement be P(n), i.e.,

P(n): 1.2.3 + 2.3.4 + ... + n(n + 1) (n + 2) = 
$$\frac{n(n+1)(n+2)(n+3)}{4}$$

For n = 1, we have

P(1): 1.2.3 = 6 = 
$$\frac{1(1+1)(1+2)(1+3)}{4} = \frac{1.2.3.4}{4} = 6$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$1.2.3 + 2.3.4 + \dots + k(k+1)(k+2) = \frac{k(k+1)(k+2)(k+3)}{4} \qquad \dots (i)$$

We shall now prove that P(k + 1) is true.

Consider

$$1.2.3 + 2.3.4 + \dots + k(k+1)(k+2) + (k+1)(k+2)(k+3)$$

$$= \{1.2.3 + 2.3.4 + \dots + k(k+1)(k+2)\} + (k+1)(k+2)(k+3)$$

$$= \frac{k(k+1)(k+2)(k+3)}{4} + (k+1)(k+2)(k+3) \qquad [Using (i)]$$
  
=  $(k+1)(k+2)(k+3)\left(\frac{k}{4}+1\right)$   
=  $\frac{(k+1)(k+2)(k+3)(k+4)}{4}$   
=  $\frac{(k+1)(k+1+1)(k+1+2)(k+1+3)}{4}$ 

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

### Q5 :

all 
$$n \in N$$
:  $1.3 + 2.3^2 + 3.3^3 + ... + n.3^n = \frac{(2n-1)3^{n+1} + 3}{4}$ 

Let the given statement be P(n), i.e.,

P(n): 
$$1.3 + 2.3^2 + 3.3^3 + ... + n3^n = \frac{(2n-1)3^{n+1} + 3}{4}$$

For n = 1, we have

P(1): 1.3 = 3 = 
$$\frac{(2.1-1)3^{1+1}+3}{4} = \frac{3^2+3}{4} = \frac{12}{4} = 3$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$1.3 + 2.3^{2} + 3.3^{3} + \dots + k3^{k} = \frac{(2k-1)3^{k+1} + 3}{4} \qquad \dots (i)$$

We shall now prove that P(k + 1) is true.

Consider

$$1.3 + 2.3^{2} + 3.3^{3} + \dots + k3^{k} + (k + 1) 3^{k+1}$$

$$= (1.3 + 2.3^{2} + 3.3^{3} + \dots + k.3^{k}) + (k + 1) 3^{k+1}$$

$$= \frac{(2k - 1)3^{k+1} + 3}{4} + (k + 1)3^{k+1}}{4}$$

$$= \frac{(2k - 1)3^{k+1} + 3 + 4(k + 1)3^{k+1}}{4}$$

$$= \frac{3^{k+1} \{2k - 1 + 4(k + 1)\} + 3}{4}$$

$$= \frac{3^{k+1} \{6k + 3\} + 3}{4}$$

$$= \frac{3^{k+1} \{6k + 3\} + 3}{4}$$

$$= \frac{3^{(k+1)+1} \{2k + 1\} + 3}{4}$$

$$= \frac{3^{(k+1)+1} \{2k + 1\} + 3}{4}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

Q6 :

all 
$$n \in N$$
:  $1.2 + 2.3 + 3.4 + ... + n.(n+1) = \left[\frac{n(n+1)(n+2)}{3}\right]$ 

Let the given statement be P(n), i.e.,

$$1.2 + 2.3 + 3.4 + \dots + n.(n+1) = \left[\frac{n(n+1)(n+2)}{3}\right]$$

For n = 1, we have

P(*n*):

P(1): 
$$1.2 = 2 = \frac{1(1+1)(1+2)}{3} = \frac{1.2.3}{3} = 2$$
, which is true

Let P(k) be true for some positive integer k, i.e.,

$$1.2 + 2.3 + 3.4 + \dots + k.(k+1) = \left[\frac{k(k+1)(k+2)}{3}\right] \dots (i)$$

We shall now prove that P(k + 1) is true.

Consider

$$1.2 + 2.3 + 3.4 + \dots + k.(k+1) + (k+1).(k+2)$$
  
=  $[1.2 + 2.3 + 3.4 + \dots + k.(k+1)] + (k+1).(k+2)$   
=  $\frac{k(k+1)(k+2)}{3} + (k+1)(k+2)$  [Using (i)]  
=  $(k+1)(k+2)\left(\frac{k}{3}+1\right)$   
=  $\frac{(k+1)(k+2)(k+3)}{3}$   
=  $\frac{(k+1)(k+1+1)(k+1+2)}{3}$ 

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

# Q7 :

all 
$$n \in N$$
:  $1.3 + 3.5 + 5.7 + ... + (2n-1)(2n+1) = \frac{n(4n^2 + 6n - 1)}{3}$ 

Let the given statement be P(n), i.e.,

P(n): 
$$1.3 + 3.5 + 5.7 + ... + (2n-1)(2n+1) = \frac{n(4n^2 + 6n-1)}{3}$$

For n = 1, we have

P(1):1.3 = 3 = 
$$\frac{1(4.1^2 + 6.1 - 1)}{3} = \frac{4 + 6 - 1}{3} = \frac{9}{3} = 3$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$1.3 + 3.5 + 5.7 + \dots + (2k-1)(2k+1) = \frac{k(4k^2 + 6k-1)}{3} \dots (i)$$

We shall now prove that P(k + 1) is true.

$$(1.3 + 3.5 + 5.7 + ... + (2k - 1) (2k + 1) + (2(k + 1) - 1){2(k + 1) + 1}$$

$$= \frac{k(4k^{2} + 6k - 1)}{3} + (2k + 2 - 1)(2k + 2 + 1) \qquad [Using (i)]$$

$$= \frac{k(4k^{2} + 6k - 1)}{3} + (2k + 1)(2k + 3)$$

$$= \frac{k(4k^{2} + 6k - 1) + 3(4k^{2} + 8k + 3)}{3}$$

$$= \frac{4k^{3} + 6k^{2} - k + 12k^{2} + 24k + 9}{3}$$

$$= \frac{4k^{3} + 18k^{2} + 23k + 9}{3}$$

$$= \frac{4k^{3} + 18k^{2} + 9k + 4k^{2} + 14k + 9}{3}$$

$$= \frac{k(4k^{2} + 14k + 9) + 1(4k^{2} + 14k + 9)}{3}$$

$$=\frac{(k+1)\{4k^2+8k+4+6k+6-1\}}{3}$$
$$=\frac{(k+1)\{4(k^2+2k+1)+6(k+1)-1\}}{3}$$
$$=\frac{(k+1)\{4(k+1)^2+6(k+1)-1\}}{3}$$

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n

# Q8 :

Prove the following by using the principle of mathematical induction for all  $n \in N$ :  $1.2 + 2.2^2 + 3.2^2 + ... + n.2^n = (n - 1) 2^{n+1} + 2$ 

#### Answer :

Let the given statement be P(n), i.e.,

P(n):  $1.2 + 2.2^2 + 3.2^2 + ... + n.2^n = (n - 1) 2^{n+1} + 2$ 

For n = 1, we have

P(1):  $1.2 = 2 = (1 - 1) 2^{1+1} + 2 = 0 + 2 = 2$ , which is true.

Let P(k) be true for some positive integer k, i.e.,  $1.2 + 2.2^2$ 

+ 3.2<sup>2</sup> + ... +  $k.2^{k} = (k - 1) 2^{k+1} + 2 ... (i)$ 

We shall now prove that P(k + 1) is true.

Consider

$$\{1.2 + 2.2^2 + 3.2^3 + \dots + k.2^k\} + (k+1) \cdot 2^{k+1}$$
  
=  $(k-1)2^{k+1} + 2 + (k+1)2^{k+1}$   
=  $2^{k+1}\{(k-1) + (k+1)\} + 2$   
=  $2^{k+1}.2k + 2$   
=  $k.2^{(k+1)+1} + 2$   
=  $\{(k+1)-1\}2^{(k+1)+1} + 2$ 

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n

Q9 :

Prove the following by using the principle of mathematical induction for

all 
$$n \in N$$
:  $\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots + \frac{1}{2^n} = 1 - \frac{1}{2^n}$ 

#### Answer :

Let the given statement be P(n), i.e.,

P(n): 
$$\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots + \frac{1}{2^n} = 1 - \frac{1}{2^n}$$

For n = 1, we have

P(1): 
$$\frac{1}{2} = 1 - \frac{1}{2^1} = \frac{1}{2}$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots + \frac{1}{2^k} = 1 - \frac{1}{2^k} \qquad \dots (i)$$

We shall now prove that P(k + 1) is true.

Consider

$$\begin{pmatrix} \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots + \frac{1}{2^{k}} \end{pmatrix} + \frac{1}{2^{k+1}}$$

$$= \left(1 - \frac{1}{2^{k}}\right) + \frac{1}{2^{k+1}}$$

$$= 1 - \frac{1}{2^{k}} + \frac{1}{2 \cdot 2^{k}}$$

$$= 1 - \frac{1}{2^{k}} \left(1 - \frac{1}{2}\right)$$

$$= 1 - \frac{1}{2^{k}} \left(\frac{1}{2}\right)$$

$$= 1 - \frac{1}{2^{k+1}}$$

$$[Using (i)]$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n

#### Q10 :

all 
$$n \in N$$
:  $\frac{1}{2.5} + \frac{1}{5.8} + \frac{1}{8.11} + \dots + \frac{1}{(3n-1)(3n+2)} = \frac{n}{(6n+4)}$ 

Let the given statement be P(n), i.e.,

P(n): 
$$\frac{1}{2.5} + \frac{1}{5.8} + \frac{1}{8.11} + \dots + \frac{1}{(3n-1)(3n+2)} = \frac{n}{(6n+4)}$$

For n = 1, we have

$$P(1) = \frac{1}{2.5} = \frac{1}{10} = \frac{1}{6.1+4} = \frac{1}{10}$$
, which is true

Let P(k) be true for some positive integer k, i.e.,

$$\frac{1}{2.5} + \frac{1}{5.8} + \frac{1}{8.11} + \dots + \frac{1}{(3k-1)(3k+2)} = \frac{k}{6k+4} \qquad \dots (i)$$

We shall now prove that P(k + 1) is true.

$$\frac{1}{2.5} + \frac{1}{5.8} + \frac{1}{8.11} + \dots + \frac{1}{(3k-1)(3k+2)} + \frac{1}{\{3(k+1)-1\}} \{3(k+1)+2\}}$$

$$= \frac{k}{6k+4} + \frac{1}{(3k+3-1)(3k+3+2)} \qquad [Using (i)]$$

$$= \frac{k}{6k+4} + \frac{1}{(3k+2)(3k+5)}$$

$$= \frac{k}{2(3k+2)} + \frac{1}{(3k+2)(3k+5)}$$

$$= \frac{1}{(3k+2)} \left(\frac{k}{2} + \frac{1}{3k+5}\right)$$

$$= \frac{1}{(3k+2)} \left(\frac{k(3k+5)+2}{2(3k+5)}\right)$$

$$= \frac{1}{(3k+2)} \left(\frac{3k^2+5k+2}{2(3k+5)}\right)$$

$$= \frac{1}{(3k+2)} \left(\frac{(3k+2)(k+1)}{2(3k+5)}\right)$$

$$= \frac{(k+1)}{6(k+1)+4}$$

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n

# Q11 :

Prove the following by using the principle of mathematical induction for

all 
$$n \in N$$
:  $\frac{1}{1.2.3} + \frac{1}{2.3.4} + \frac{1}{3.4.5} + \dots + \frac{1}{n(n+1)(n+2)} = \frac{n(n+3)}{4(n+1)(n+2)}$ 

#### Answer :

Let the given statement be P(n), i.e.,

$$\Pr(n): \frac{1}{1.2.3} + \frac{1}{2.3.4} + \frac{1}{3.4.5} + \dots + \frac{1}{n(n+1)(n+2)} = \frac{n(n+3)}{4(n+1)(n+2)}$$

For n = 1, we have

$$P(1): \frac{1}{1\cdot 2\cdot 3} = \frac{1\cdot (1+3)}{4(1+1)(1+2)} = \frac{1\cdot 4}{4\cdot 2\cdot 3} = \frac{1}{1\cdot 2\cdot 3}$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$\frac{1}{1\cdot 2\cdot 3} + \frac{1}{2\cdot 3\cdot 4} + \frac{1}{3\cdot 4\cdot 5} + \dots + \frac{1}{k(k+1)(k+2)} = \frac{k(k+3)}{4(k+1)(k+2)} \dots (i)$$

We shall now prove that P(k + 1) is true.

$$\begin{bmatrix} \frac{1}{1 \cdot 2 \cdot 3} + \frac{1}{2 \cdot 3 \cdot 4} + \frac{1}{3 \cdot 4 \cdot 5} + \dots + \frac{1}{k(k+1)(k+2)} \end{bmatrix} + \frac{1}{(k+1)(k+2)(k+3)}$$

$$= \frac{k(k+3)}{4(k+1)(k+2)} + \frac{1}{(k+1)(k+2)(k+3)}$$
[Using (i)]
$$= \frac{1}{(k+1)(k+2)} \left\{ \frac{k(k+3)^2 + 4}{4(k+3)} \right\}$$

$$= \frac{1}{(k+1)(k+2)} \left\{ \frac{k(k^2 + 6k + 9) + 4}{4(k+3)} \right\}$$

$$= \frac{1}{(k+1)(k+2)} \left\{ \frac{k^3 + 6k^2 + 9k + 4}{4(k+3)} \right\}$$

$$= \frac{1}{(k+1)(k+2)} \left\{ \frac{k^3 + 2k^2 + k + 4k^2 + 8k + 4}{4(k+3)} \right\}$$

$$= \frac{1}{(k+1)(k+2)} \left\{ \frac{k(k^2 + 2k + 1) + 4(k^2 + 2k + 1)}{4(k+3)} \right\}$$

$$= \frac{1}{(k+1)(k+2)} \left\{ \frac{k(k+1)^2 + 4(k+1)^2}{4(k+3)} \right\}$$

$$= \frac{(k+1)^2(k+4)}{4(k+1)(k+2)(k+3)}$$

$$= \frac{(k+1)^2(k+4)}{4(k+1)+1} \left\{ (k+1) + 2 \right\}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

# Q12 :

all 
$$n \in N$$
:  $a + ar + ar^2 + ... + ar^{n-1} = \frac{a(r^n - 1)}{r - 1}$ 

Let the given statement be P(n), i.e.,

$$P(n): a + ar + ar^{2} + ... + ar^{n-1} = \frac{a(r^{n}-1)}{r-1}$$

For n = 1, we have

$$\mathbf{P}(1)$$
:  $a = \frac{a(r^1-1)}{(r-1)} = a$  , which is true

Let P(k) be true for some positive integer k, i.e.,

$$a + ar + ar^{2} + \dots + ar^{k-1} = \frac{a(r^{k} - 1)}{r - 1} \dots$$
(i)

We shall now prove that P(k + 1) is true.

Consider

$$\left\{ a + ar + ar^{2} + \dots + ar^{k-1} \right\} + ar^{(k+1)-1}$$

$$= \frac{a(r^{k} - 1)}{r - 1} + ar^{k} \qquad [Using(i)]$$

$$= \frac{a(r^{k} - 1) + ar^{k} (r - 1)}{r - 1}$$

$$= \frac{a(r^{k} - 1) + ar^{k+1} - ar^{k}}{r - 1}$$

$$= \frac{ar^{k} - a + ar^{k+1} - ar^{k}}{r - 1}$$

$$= \frac{ar^{k+1} - a}{r - 1}$$

$$= \frac{a(r^{k+1} - 1)}{r - 1}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

# Q13 :

all 
$$n \in N$$
:  $\left(1 + \frac{3}{1}\right)\left(1 + \frac{5}{4}\right)\left(1 + \frac{7}{9}\right)...\left(1 + \frac{(2n+1)}{n^2}\right) = (n+1)^2$ 

Let the given statement be P(n), i.e.,

$$P(n):\left(1+\frac{3}{1}\right)\left(1+\frac{5}{4}\right)\left(1+\frac{7}{9}\right)...\left(1+\frac{(2n+1)}{n^2}\right)=(n+1)^2$$

For n = 1, we have

P(1): 
$$\left(1+\frac{3}{1}\right) = 4 = \left(1+1\right)^2 = 2^2 = 4$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$\left(1+\frac{3}{1}\right)\left(1+\frac{5}{4}\right)\left(1+\frac{7}{9}\right)\dots\left(1+\frac{(2k+1)}{k^2}\right) = (k+1)^2 \qquad \dots (1)$$

We shall now prove that P(k + 1) is true.

Consider

$$\begin{bmatrix} \left(1+\frac{3}{1}\right)\left(1+\frac{5}{4}\right)\left(1+\frac{7}{9}\right)...\left(1+\frac{(2k+1)}{k^2}\right) \end{bmatrix} \left\{1+\frac{\left\{2(k+1)+1\right\}}{(k+1)^2}\right\}$$

$$= (k+1)^2 \left(1+\frac{2(k+1)+1}{(k+1)^2}\right) \qquad \qquad \begin{bmatrix} \text{Using}(1) \end{bmatrix}$$

$$= (k+1)^2 \left[\frac{(k+1)^2+2(k+1)+1}{(k+1)^2}\right]$$

$$= (k+1)^2+2(k+1)+1$$

$$= \left\{(k+1)+1\right\}^2$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

# Q14 :

Prove the following by using the principle of mathematical induction for

all 
$$n \in N$$
:  $\left(1 + \frac{1}{1}\right)\left(1 + \frac{1}{2}\right)\left(1 + \frac{1}{3}\right)...\left(1 + \frac{1}{n}\right) = (n+1)$ 

#### Answer :

Let the given statement be P(n), i.e.,

$$P(n): \left(1+\frac{1}{1}\right) \left(1+\frac{1}{2}\right) \left(1+\frac{1}{3}\right) \dots \left(1+\frac{1}{n}\right) = (n+1)$$

For n = 1, we have

$$P(1):(1+\frac{1}{1})=2=(1+1)$$
 , which is true

Let P(k) be true for some positive integer k, i.e.,

$$P(k):\left(1+\frac{1}{1}\right)\left(1+\frac{1}{2}\right)\left(1+\frac{1}{3}\right)...\left(1+\frac{1}{k}\right)=(k+1) \qquad ... (1)$$

We shall now prove that P(k + 1) is true.

Consider

$$\begin{bmatrix} \left(1+\frac{1}{1}\right)\left(1+\frac{1}{2}\right)\left(1+\frac{1}{3}\right)...\left(1+\frac{1}{k}\right)\end{bmatrix}\left(1+\frac{1}{k+1}\right) \\ = (k+1)\left(1+\frac{1}{k+1}\right) \\ = (k+1)\left(\frac{(k+1)+1}{(k+1)}\right) \\ = (k+1)+1 \end{bmatrix}$$
[Using (1)]

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

# Q15 :

## Prove the following by using the principle of mathematical induction for

all 
$$n \in N$$
:  $1^2 + 3^2 + 5^2 + ... + (2n-1)^2 = \frac{n(2n-1)(2n+1)}{3}$ 

#### Answer :

Let the given statement be P(n), i.e.,

$$P(n) = 1^{2} + 3^{2} + 5^{2} + \dots + (2n-1)^{2} = \frac{n(2n-1)(2n+1)}{3}$$

For n = 1, we have

$$P(1) = 1^2 = 1 = \frac{1(2.1-1)(2.1+1)}{3} = \frac{1.1.3}{3} = 1$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$P(k) = 1^{2} + 3^{2} + 5^{2} + \dots + (2k-1)^{2} = \frac{k(2k-1)(2k+1)}{3} \qquad \dots (1)$$

We shall now prove that P(k + 1) is true.

Consider

$$\left\{ l^{2} + 3^{2} + 5^{2} + ... + (2k-1)^{2} \right\} + \left\{ 2(k+1) - 1 \right\}^{2}$$

$$= \frac{k(2k-1)(2k+1)}{3} + (2k+2-1)^{2} \qquad [Using (1)]$$

$$= \frac{k(2k-1)(2k+1)}{3} + (2k+1)^{2}$$

$$= \frac{k(2k-1)(2k+1) + 3(2k+1)^{2}}{3}$$

$$= \frac{(2k+1)\left\{ k(2k-1) + 3(2k+1) \right\}}{3}$$

$$= \frac{(2k+1)\left\{ 2k^{2} - k + 6k + 3 \right\}}{3}$$

$$= \frac{(2k+1)\left\{ 2k^{2} + 2k + 3k + 3 \right\}}{3}$$

$$= \frac{(2k+1)\left\{ 2k(k+1) + 3(k+1) \right\}}{3}$$

$$= \frac{(2k+1)\left\{ 2k(k+1) + 3(k+1) \right\}}{3}$$

$$= \frac{(2k+1)\left\{ 2k(k+1) - 1 \right\}\left\{ 2(k+1) + 1 \right\}}{3}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

# Q16 :

## Prove the following by using the principle of mathematical induction for

all 
$$n \in N$$
:  $\frac{1}{1.4} + \frac{1}{4.7} + \frac{1}{7.10} + \dots + \frac{1}{(3n-2)(3n+1)} = \frac{n}{(3n+1)}$ 

# Answer :

Let the given statement be P(n), i.e.,

$$P(n): \frac{1}{1.4} + \frac{1}{4.7} + \frac{1}{7.10} + \dots + \frac{1}{(3n-2)(3n+1)} = \frac{n}{(3n+1)}$$

For n = 1, we have

$$P(1) = \frac{1}{1.4} = \frac{1}{3.1+1} = \frac{1}{4} = \frac{1}{1.4}$$
, which is true.

Let P(k) be true for some positive integer k, i.e.,

$$P(k) = \frac{1}{1.4} + \frac{1}{4.7} + \frac{1}{7.10} + \dots + \frac{1}{(3k-2)(3k+1)} = \frac{k}{3k+1} \qquad \dots (1)$$

We shall now prove that P(k + 1) is true.

Consider

$$\begin{cases} \frac{1}{1.4} + \frac{1}{4.7} + \frac{1}{7.10} + \dots + \frac{1}{(3k-2)(3k+1)} \\ + \frac{1}{\{3(k+1)-2\}\{3(k+1)+1\}} \\ = \frac{k}{3k+1} + \frac{1}{(3k+1)(3k+4)} \\ = \frac{1}{(3k+1)} \left\{ k + \frac{1}{(3k+4)} \right\} \\ = \frac{1}{(3k+1)} \left\{ \frac{k(3k+4)+1}{(3k+4)} \right\} \\ = \frac{1}{(3k+1)} \left\{ \frac{3k^2 + 4k + 1}{(3k+4)} \right\} \\ = \frac{1}{(3k+1)} \left\{ \frac{3k^2 + 3k + k + 1}{(3k+4)} \right\} \\ = \frac{(3k+1)(k+1)}{(3k+1)(3k+4)} \\ = \frac{(k+1)}{3(k+1)+1} \end{cases}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

Q17 :

Prove the following by using the principle of mathematical induction for

all 
$$n \in N$$
:  $\frac{1}{3.5} + \frac{1}{5.7} + \frac{1}{7.9} + \dots + \frac{1}{(2n+1)(2n+3)} = \frac{n}{3(2n+3)}$ 

# Answer :

Let the given statement be P(n), i.e.,

$$P(n):\frac{1}{3.5} + \frac{1}{5.7} + \frac{1}{7.9} + \dots + \frac{1}{(2n+1)(2n+3)} = \frac{n}{3(2n+3)}$$

For n = 1, we have

$$P(1): \frac{1}{3.5} = \frac{1}{3(2.1+3)} = \frac{1}{3.5}$$
, which is true

Let P(k) be true for some positive integer k, i.e.,

$$P(k): \frac{1}{3.5} + \frac{1}{5.7} + \frac{1}{7.9} + \dots + \frac{1}{(2k+1)(2k+3)} = \frac{k}{3(2k+3)} \qquad \dots (1)$$

We shall now prove that P(k + 1) is true.

$$\begin{bmatrix} \frac{1}{3.5} + \frac{1}{5.7} + \frac{1}{7.9} + \dots + \frac{1}{(2k+1)(2k+3)} \end{bmatrix} + \frac{1}{\{2(k+1)+1\}\{2(k+1)+3\}}$$

$$= \frac{k}{3(2k+3)} + \frac{1}{(2k+3)(2k+5)} \qquad [Using (1)]$$

$$= \frac{1}{(2k+3)} \begin{bmatrix} \frac{k}{3} + \frac{1}{(2k+5)} \end{bmatrix}$$

$$= \frac{1}{(2k+3)} \begin{bmatrix} \frac{k(2k+5)+3}{3(2k+5)} \end{bmatrix}$$

$$= \frac{1}{(2k+3)} \begin{bmatrix} \frac{2k^2+5k+3}{3(2k+5)} \end{bmatrix}$$

$$= \frac{1}{(2k+3)} \begin{bmatrix} \frac{2k^2+2k+3k+3}{3(2k+5)} \end{bmatrix}$$

$$= \frac{1}{(2k+3)} \begin{bmatrix} \frac{2k(k+1)+3(k+1)}{3(2k+5)} \end{bmatrix}$$

$$= \frac{(k+1)(2k+3)}{3(2k+3)(2k+5)}$$

$$= \frac{(k+1)}{3\{2(k+1)+3\}}$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n

# Q18 :

# Prove the following by using the principle of mathematical induction for

all  $n \in N$ :  $1+2+3+\ldots+n < \frac{1}{8}(2n+1)^2$ 

#### Answer :

Let the given statement be P(n), i.e.,

$$P(n): 1+2+3+...+n < \frac{1}{8}(2n+1)^2$$

It can be noted that P(n) is true for n = 1 since  $1 < \frac{1}{8}(2.1+1)^2 = \frac{9}{8}$ 

Let P(k) be true for some positive integer k, i.e.,

$$1+2+\ldots+k < \frac{1}{8}(2k+1)^2$$
 ... (1)

We shall now prove that P(k + 1) is true whenever P(k) is true.

Consider

$$(1+2+...+k)+(k+1) < \frac{1}{8}(2k+1)^{2}+(k+1) \qquad [Using(1)]$$

$$<\frac{1}{8}\{(2k+1)^{2}+8(k+1)\}$$

$$<\frac{1}{8}\{4k^{2}+4k+1+8k+8\}$$

$$<\frac{1}{8}\{4k^{2}+12k+9\}$$

$$<\frac{1}{8}\{2k+3)^{2}$$

$$<\frac{1}{8}\{2(k+1)+1\}^{2}$$
Hence,
$$(1+2+3+...+k)+(k+1) < \frac{1}{8}(2k+1)^{2}+(k+1)$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

## Q19:

Prove the following by using the principle of mathematical induction for all  $n \in N$ : n(n + 1)(n + 5) is a multiple of 3.

#### Answer:

Let the given statement be P(n), i.e.,

P(n): n(n + 1)(n + 5), which is a multiple of 3.

It can be noted that P(n) is true for n = 1 since 1(1 + 1)(1 + 5) = 12, which is a multiple of 3.

Let P(k) be true for some positive integer k, i.e.,

k(k+1)(k+5) is a multiple of 3.

:: k(k + 1)(k + 5) = 3m, where  $m \in \mathbb{N}$  ... (1)

We shall now prove that P(k + 1) is true whenever P(k) is true.

$$(k+1)\{(k+1)+1\}\{(k+1)+5\}$$

$$= (k+1)(k+2)\{(k+5)+1\}$$

$$= (k+1)(k+2)(k+5)+(k+1)(k+2)$$

$$= \{k(k+1)(k+5)+2(k+1)(k+5)\}+(k+1)(k+2)$$

$$= 3m + (k+1)\{2(k+5)+(k+2)\}$$

$$= 3m + (k+1)\{2k+10+k+2\}$$

$$= 3m + (k+1)(3k+12)$$

$$= 3m + (k+1)(k+4)$$

$$= 3\{m + (k+1)(k+4)\} = 3 \times q, \text{ where } q = \{m + (k+1)(k+4)\} \text{ is some natural number Therefore, } (k+1)\{(k+1)+1\}\{(k+1)+5\} \text{ is a multiple of } 3.$$

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

#### Q20:

Prove the following by using the principle of mathematical induction for all  $n \in N$ :  $10^{2n-1} + 1$  is divisible by 11.

#### Answer :

Let the given statement be P(n), i.e., P(n):  $10^{2n-1} + 1$  is divisible by 11. It can be observed that P(n) is true for n = 1 since  $P(1) = 10^{2.1 - 1} + 1 = 11$ , which is divisible by 11. Let P(k) be true for some positive integer k, i.e.,  $10^{2k-1} + 1$  is divisible by 11.  $\therefore 10^{2k-1} + 1 = 11m$ , where  $m \in \mathbb{N}$  ... (1)

We shall now prove that P(k + 1) is true whenever P(k) is true.

$$10^{2(k+1)-1} + 1$$
  
=  $10^{2k+2-1} + 1$   
=  $10^{2(k+1)} + 1$   
=  $10^{2} (10^{2k-1} + 1 - 1) + 1$   
=  $10^{2} (10^{2k-1} + 1) - 10^{2} + 1$   
=  $10^{2} \cdot 11m - 100 + 1$  [Using (1)]  
=  $100 \times 11m - 99$   
=  $11(100m - 9)$   
=  $11r$ , where  $r = (100m - 9)$  is some natural number  
Therefore,  $10^{2(k+1)-1} + 1$  is divisible by 11.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

### Q21 :

Prove the following by using the principle of mathematical induction for all  $n \in N$ :  $x^{2n} - y^{2n}$  is divisible by x + y.

#### Answer :

Let the given statement be P(*n*), i.e., P(*n*):  $x^{2n}$ -  $y^{2n}$  is divisible by x + y.

It can be observed that P(n) is true for n = 1.

This is so because  $x^{2 \times 1} - y^{2 \times 1} = x^{2} - y^{2} = (x + y) (x - y)$  is divisible by (x + y).

Let P(k) be true for some positive integer k, i.e.,  $x^{2k} - y^{2k}$  is divisible by x + y.

 $\therefore x^{2k} - y^{2k} = m(x + y)$ , where  $m \in \mathbb{N}$  ... (1)

We shall now prove that P(k + 1) is true whenever P(k) is true.

$$\begin{aligned} x^{2(k+1)} &- y^{2(k+1)} \\ &= x^{2k} \cdot x^2 - y^{2k} \cdot y^2 \\ &= x^2 \left( x^{2k} - y^{2k} + y^{2k} \right) - y^{2k} \cdot y^2 \\ &= x^2 \left\{ m(x+y) + y^{2k} \right\} - y^{2k} \cdot y^2 \qquad \left[ \text{Using (1)} \right] \\ &= m(x+y)x^2 + y^{2k} \cdot x^2 - y^{2k} \cdot y^2 \\ &= m(x+y)x^2 + y^{2k} \left( x^2 - y^2 \right) \\ &= m(x+y)x^2 + y^{2k} \left( x^2 - y^2 \right) \\ &= m(x+y)x^2 + y^{2k} \left( x + y \right) (x-y) \\ &= (x+y) \left\{ mx^2 + y^{2k} \left( x - y \right) \right\}, \text{ which is a factor of } (x+y). \end{aligned}$$

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n

## Q22 :

Prove the following by using the principle of mathematical induction for all  $n \in N$ :  $3^{2n+2} - 8n - 9$  is divisible by 8.

#### Answer :

Let the given statement be P(n), i.e., P(n):  $3^{2n+2} - 8n - 9$  is divisible by 8.

It can be observed that P(n) is true for n = 1 since  $3^{2 \times 1+2} - 8 \times 1 - 9 = 64$ , which is divisible by 8.

Let P(k) be true for some positive integer k, i.e.,  $3^{2k+2} - 8k - 9$  is divisible by 8.

 $::3^{2k+2} - 8k - 9 = 8m$ ; where  $m \in \mathbb{N}$  ... (1)

We shall now prove that P(k + 1) is true whenever P(k) is true.

$$3^{2(k+1)+2} - 8(k+1) - 9$$
  
=  $3^{2k+2} \cdot 3^2 - 8k - 8 - 9$   
=  $3^2 (3^{2k+2} - 8k - 9 + 8k + 9) - 8k - 17$   
=  $3^2 (3^{2k+2} - 8k - 9) + 3^2 (8k + 9) - 8k - 17$   
=  $9.8m + 9(8k + 9) - 8k - 17$   
=  $9.8m + 72k + 81 - 8k - 17$   
=  $9.8m + 64k + 64$   
=  $8(9m + 8k + 8)$   
=  $8r$ , where  $r = (9m + 8k + 8)$  is a natural number  
Therefore,  $3^{2(k+1)+2} - 8(k+1) - 9$  is divisible by 8.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

### Q23 :

Prove the following by using the principle of mathematical induction for all  $n \in N$ : 41<sup>*n*</sup> - 14<sup>*n*</sup> is a multiple of 27.

#### Answer :

Let the given statement be P(n), i.e.,

P(*n*): 41<sup>*n*</sup> - 14<sup>*n*</sup> is a multiple of 27.

It can be observed that P(n) is true for n = 1 since  $41^1 - 14^1 = 27$ , which is a multiple of 27.

Let P(k) be true for some positive integer k, i.e.,

41<sup>k</sup> - 14<sup>k</sup> is a multiple of 27

 $\therefore 41^k - 14^k = 27m$ , where  $m \in \mathbb{N} \dots (1)$ 

We shall now prove that P(k + 1) is true whenever P(k) is true.

$$41^{k+1} - 14^{k+1}$$
  
=  $41^{k} \cdot 41 - 14^{k} \cdot 14$   
=  $41(41^{k} - 14^{k} + 14^{k}) - 14^{k} \cdot 14$   
=  $41(41^{k} - 14^{k}) + 41.14^{k} - 14^{k} \cdot 14$   
=  $41.27m + 14^{k} (41 - 14)$   
=  $41.27m + 27.14^{k}$   
=  $27(41m - 14^{k})$   
=  $27 \times r$ , where  $r = (41m - 14^{k})$  is a natural number

Therefore,  $41^{k+1} - 14^{k+1}$  is a multiple of 27.

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.

## Q24 :

# Prove the following by using the principle of mathematical induction for all $n \in \mathbb{N}$ :

 $(2n+7) < (n+3)^2$ 

#### Answer :

Let the given statement be P(n), i.e.,

 $P(n): (2n+7) < (n+3)^2$ 

It can be observed that P(n) is true for n = 1 since  $2 \cdot 1 + 7 = 9 < (1 + 3)^2 = 16$ , which is true.

Let P(k) be true for some positive integer k, i.e.,

$$(2k+7) < (k+3)^2 \dots (1)$$

We shall now prove that P(k + 1) is true whenever P(k) is true.

Consider

$$\{2(k+1)+7\} = (2k+7)+2 \therefore \{2(k+1)+7\} = (2k+7)+2 < (k+3)^2 + 2 \qquad [u \sin g (1)] 2(k+1)+7 < k^2 + 6k + 9 + 2 2(k+1)+7 < k^2 + 6k + 11 Now, k^2 + 6k + 11 < k^2 + 8k + 16 \therefore 2(k+1)+7 < (k+4)^2 2(k+1)+7 < {(k+1)+3}^2$$

Thus, P(k + 1) is true whenever P(k) is true.

Hence, by the principle of mathematical induction, statement P(n) is true for all natural numbers i.e., n.
